1 Survey overview

Background to the SHS

The Scottish Household Survey (SHS) is a continuous, large-scale social survey of the composition and characteristics of Scottish households, the attitudes and behaviour of adults, and to a lesser extent, of children within these households. It was first commissioned by the Scottish Executive in 1998 and has been collecting data and reporting since February 1999.

The specific aims of the survey are as follows:

- to provide household and individual information previously unavailable in Scotland, particularly to support the work of the Scottish Executive's transport, communities and local government policy areas and the work of the Scottish Parliament
- to permit disaggregation of such information both geographically and in terms of population sub-groups (such as families with children or the elderly)
- to allow the relationships between social variables within households to be examined, supporting cross-departmental and inter-departmental policies such as those on social justice
- to allow early detection of national trends
- to allow detailed follow-up surveys of sub-samples from the main survey sample, if required.

The survey is funded by the Scottish Government and carried by a consortium of research organisations involving Ipsos MORI and TNS BMRB.

This document provides details of the questionnaire used for the survey in 2009, including noting changes since 2006.

Survey design and sampling

This section gives a brief overview of the survey design and sampling. A more detailed account of the technical aspects of the survey, as well as details of response rates and data quality can be found in the accompanying Technical Report.

As part of the tendering process for the survey in 2006, tenderers were invited to propose a sampling strategy that maximised the cost-effectiveness of the survey sampling ie achieved the level of precision required from the survey at the lowest cost. Like the sampling strategies used between 1999 and 2006, the current sample design uses a multi-stage stratified design with a mix of clustered and unclustered sampling. The main features of the current design are:

- first stage, disproportionate stratification by local authority
- within each local authority, second stage stratification by the Scottish Government's six-fold urban rural classification – large urban and other urban areas combined into an 'urban' stratum and all other areas combined into a 'rural' stratum
- unclustered sampling is used in the 'urban' strata, with addresses sorted by SIMD and selected systematically from a random starting point

- clustered sampling is used in the ‘rural’ strata, with datazones used as primary sampling units (PSUs), which are selected with probability proportionate to size and, within each, a systematic sample selected from a random starting point.

There are some variations to this overall design.

- In local authorities with 80% or more of the household population in ‘urban’ areas, the sample is wholly unclustered
- In local authorities with 80% or more of the household population in ‘rural’ areas, the sample is wholly clustered
- The local authorities of Western Isles, Orkney and Shetland have wholly unclustered samples even though the urban rural classification suggests they should be wholly clustered. The reason for this is that the sample size in these areas means that between 1 in 6 and 1 in 8 households should be sampled. Clustered samples in these areas would be no more efficient than an unclustered sample but would require larger samples for the same level of precision.

1.1.1 Streaming and sub-sampling

Because of the high level of demand for space in the Scottish Household Survey, a number of sections of the questionnaire were intended to be asked random sub-samples of the full SHS sample. This is achieved by randomly assigning addresses to one of ten sub-samples, which we refer to as ‘streams’ within the interview. Two streams (1 and 6) are reserved for the Culture and Sport module.¹ The remaining eight are used for the ‘main’ SHS script. Streaming allows questions to be assigned to as little as one-eighth of the main sample.

1.1.2 Allocation of addresses over time and between fieldwork organisations

To accommodate the requirement to provide data that is representative nationally in each quarter, for the largest local authorities each year and for all local authorities after two years, the sample is allocated to fieldwork years and months in different ways to maximise the cost-effectiveness of the design.

	Annual data	Biennial data
Clustered areas	PSUs are allocated to years and then to months within years. Each PSU is one interviewer assignment.	
Unclustered areas	Addresses are allocated to survey years, then organised into fieldwork assignments. Batches are allocated to months within the year.	Addresses organised into fieldwork assignments. Batches are allocated to survey years and to months within the year.

The allocation of batches to months within each year follows a pattern established in previous years. As the fieldwork for the survey runs throughout the calendar year, it is important to ensure an even distribution of fieldwork assignments by geographic area and other indicators such as SIMD and the urban/rural classification. There are two main reasons for this: an uneven distribution would jeopardise the requirement for the sample to be representative of the national population on a

¹ Because there is no sub-sampling within the Culture and Sport module, all of the Culture and Sport addresses are labelled as Stream 1.

quarterly basis and some of the variables measured by the survey are likely to exhibit seasonal patterns – e.g. rates of economic activity, modes of transport.

The procedure for allocating PSUs to months of the year is derived from that developed by the Office for National Statistics (ONS) in managing the Family Expenditure Survey (FES)² and differs only in the need for the SHS sample to be spread evenly across 24 rather than 12 months.

Each year's allocation of interviewer assignments is listed by local authority and then by deprivation score, within local authority. Within each year, the listing of assignments is then labelled with a permutation of the numbers 1 to 12 representing the twelve months covered by the fieldwork. This permutation is generated with certain properties to avoid 'bunching' of interviews within particular quarters:

- the first four months are from different quarters
- every subsequent month is from the same quarter as the one four places before.

The example given by ONS (and used to allocate the 1996 FES) is as follows:

Procedure for allocating PSUs by month of fieldwork

Position in list	Month	Quarter
1, 13, 25, etc.	10	4
2, 14, 26, etc.	8	3
3, 15, 27, etc.	5	2
4, 16, 28, etc.	1	1
5, 17, 29, etc.	11	4
6, 18, 30, etc.	7	3
7, 19, 31, etc.	4	2
8, 20, 32, etc.	2	1
9, 21, 33, etc.	12	4
10, 22, 34, etc.	9	3
11, 23, 35, etc.	6	2
12, 24, 36, etc.	3	1

Batches of addresses are randomly assigned to each organisation in proportion to their fieldwork commitment.

1.1.3 Allocation of addresses to sub-samples

The survey is designed with the facility to ask certain questions of a random sub-sample of respondents. Sampled addresses have been randomly assigned to one of 10 survey streams and the routing in the questionnaire determines with streams are asked each question or block of questions.

Two streams – 1 and 6 are reserved for the survey's Culture and Sport module and the remaining eight are used with the main questionnaire to split the sample, where appropriate, into random sub-

samples. Unless otherwise stated in the notes to a question, questions are asked of all streams but where sub-sampling has been used this is indicated in the notes to the question.

Data collection

The data for the survey is collected using computer-assisted personal interviewing (CAPI) either using handheld tablet PCs or traditional laptops. Three CAPI systems have been used in 2009: TNS BMRB began using the NIPO system in January 2009. For the first half of 2009, Ipsos MORI used the In2itive system that has been used on the SHS since 1999 but in July 2009 switched to using Quancept. The changes in CAPI systems reflects the limitations of the In2itive system³ and the need to replace that to ensure that there was scope to develop the modular elements of the SHS.

³ Discussed in the more detail in the survey technical report for 2007/2008

2 Questionnaire

The following pages contain an edited version of the questionnaire for the SHS, derived from the computerised script for the survey. The starting point for the document is the script that was used in 2006. Substantial changes were made in for the start of the new contract in 2007 and deletions and additions for 2007 are noted.

The script that was launched in February 2007 was found to be too long when interviewing started – the average interview was taking 60 minutes instead of the anticipated 45 minutes. The longer script was used for the first five months of the survey but in June 2007 substantial cuts were made, mainly involving cutting the proportion of the sample being asked questions. These changes are noted in the table below.

Minor amendments were made for the start of fieldwork in 2008 and again at the start of 2009 and these are also noted in the script.

Question numbers in the script and variable names in the data

In most cases the question name used in the script matches the relevant variable in the data. However, where there are multiple parts to a question or the question is asked about a number of people, the variable name is extended by the used of alphabetical or numerical suffixes. Numerical suffixes indicate that the variable relates to one of a number of units of analysis – people etc. For example, HA5 asks for the age of each household member so the relevant variable names are HA5_1 through to HA5_10, with the extension indicating the household member the variable relates to (persons 1 to 10).

Where the extra variables relate to a question where a multiple response is allowed, letters rather than numbers are used in the variable names. For example variables relating to RB3 (neighbourhood dislikes) are called RB3A to RB3R, with each one relating to a different possible dislike about the neighbourhood. In a few cases, the way in which the variables are named is not consistent with these general conventions – for example, where new questions are added but the the names of existing variables (or previously used names) are such that they prevent the new ones being named in accordance with the convention. Increasingly, questions are being given names that try to convey the topic rather than describing where they sit in the script. These do not always translate directly to SPSS variable names so the question shows both the question name and the variable name used in the data.

One section of the questionnaire –the ‘travel diary’, which deals with respondents’ travel patterns in the previous 24 hours - is almost entirely excluded from this questionnaire. The travel diary is a very complicated set of questions containing multiple ‘loops’ and complex routing, which is difficult to reproduce on paper in a form that would be easily comprehensible. For this reason, only the section of the diary relating to one single stage journey is included here. There are also questions catering for multi-stage journeys and journeys which involve a series of calls. A full set of the questions in the travel diary is available from the SHS Project Manager on request.

The routing given in this script is a simplified version of the very complex computer-assisted personal interviewing (CAPI) programme used for the survey. For example, there are many places where the CAPI script checks the credibility of an answer to a question, produces an error message if the

interviewer has made an invalid entry or combination of entries, and requires that the error be dealt with before proceeding. The script also produces warning messages in some cases where a response appears very improbable (e.g. if the interviewer has recorded that a household has more than five cars), in which case the interviewer can either confirm the entry or go back and key in the correct value. Within each topic, filters (e.g. "if person has heard of it") apply to all subsequent questions, unless the appearance of another filter (e.g. "if person has used it") indicates otherwise. Users of the data are advised to consult the full CAPI script for the detail of the more complex routing in circumstances where the basic script given here does not fully explain the routing involved.

In multi-code questions, an asterisk (*) indicates an exclusive code i.e. an option that cannot be selected in combination with any other code. For example, None, Refused, Don't know would generally be exclusive options.

In many cases the variable naming does not follow the order in the questionnaire or there are a large number of variables related to a question. In these cases, the response options have been given alphabetical labels – A, B, C etc – to indicate how they relate to the variables in the SPSS data.

Text in braces {} is optional text substituted by the CAPI system to vary the wording of the question depending on the circumstances of the respondent. For example, question AREA3 varies for people living alone and those living with other people. For someone living alone, the question is "Where does your nearest family member live?" and for those living with other people the question is "Apart from the people you live with, where does your nearest family member live?". The question is shown as {Apart from the people you live with} where does your nearest family member live?"

	At this point the script asks about a schoolchild in the household. This may be the same child as was selected before ChCare1. The CAPI system chooses one schoolchild at random from all those in the household who were described as "at school" in question HA7 and the responsibility of the HIH at HE1. If there are no schoolchildren in the household the script goes to HF1.	Amended in January 2007: Order of questions simplified.

HH – HOUSEHOLD INCOME

The routing in the income section is particularly complex. Income information is gathered about the Highest Income Householder, his or her spouse or partner and the Random Adult. The routing will depend on who is being interviewed (HIH or partner).

Approximately 30% of all households have some missing data in the household income section either because they refuse to provide the information or they do not know some or all of the information. The information collected from these questions is used to impute values that are missing. Because of the high level of missing information in the raw data, only the final cleaned and imputed data is included in public datasets.

INTRO: The next group of questions is about your household's income. This will help us analyse the information on the survey's main topics – for example, to find out the extent of home ownership, car driving and Internet use by people with different levels of income. In order to make best use of the survey's information, we need to ask about various types of income, otherwise our results could be misleading. But please remember that everything you tell me is completely confidential, and will only be used for the purpose of producing statistics.

Sources and amounts of income from employment, benefits and other sources, employment and self-employment.

Survey administration variables and record flags

This section gives details of a range of variables collected as part of the interview but not shown in the script above. These are grouped into various categories:

- Administration variables
- Variables generated in the course of processing to flag cases
- Geographical variables
- Weight variables, and
- Variables related to when interviews are carried out.

Variable name	Variable and value labels	Explanation
UNIQID	Unique identifier	Automatically generated by CAPI script to provide a unique reference number for each case
SCRTYPE	Survey module used for respondent Value Label 1 Main 2 Culture and sport	In 2007 and 2008 Culture and Sport was the only distinct module in addition to the main SHS interview.
STREAM	Interviewing stream used for respondent Value Label 1 Stream 1 - Culture and Sport module 2 Stream 2 3 Stream 3 4 Stream 4 5 Stream 5 6 Stream 6 - not used 7 Stream 7 8 Stream 8 9 Stream 9 10 Stream 10	Sampled addresses are randomly assigned to one of 10 streams to allow questions or blocks of questions to be asked of smaller sub-samples. In 2007 and 2008, two streams (1 and 6) were reserved for the Culture and Sport module. There was no variation within the Culture and Sport module so the two streams are reduced to stream 1 in the data so that Culture and sport records can be selected using either sel if scrtype = 2 . Or sel if stream = 1 . Streaming used for individual questions is shown in the questionnaire above.

Variable name	Variable and value labels	Explanation																						
MAIN_OK	Valid interview with household respondent	Invalid records are deleted so all records have a value of 1.																						
RAND_OK	Valid random adult interview <table border="0" style="margin-left: 20px;"> <thead> <tr> <th>Value</th> <th>Label</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Complete random interview</td> </tr> <tr> <td>2</td> <td>No complete random interview</td> </tr> </tbody> </table>	Value	Label	1	Complete random interview	2	No complete random interview	<p>Where the person selected as the random adult has been interviewed, RAND_OK has a value of 1. weighted analysis of random adult will automatically include appropriate cases but unweighted analysis needs to selected cases where rand_ok = 1 . For example, to find out how many random adult respondents had a driving licence:</p> <pre>temp . sel if rand_ok = 1 . fre licence .</pre>

2	No complete random interview																							
KID_OK	Valid random schoolchild	<p>In households with one or more schoolchild living at home, one is randomly selected and questions about satisfaction with the child's schooling and the child's travel to and from school are asked of the household respondent.</p> <p>A household member is eligible to be selected as the random schoolchild if they are at school (HA7 = 7), live at home during term time (HA10 = 0) and are the responsibility of the household respondent (HE1 = 1).</p> <p>The random schoolchild and the random child can be the same person (if they are under 16 years). If the schoolchild is aged 16 and over, they may also be the random adult.</p>																						
RANKIDOK	Valid random child	<p>In households with one or more child living at home, one is randomly selected and questions about childcare arrangements are asked of the household respondent.</p> <p>A household member is eligible to be selected as the random child if they are aged under 16 (HA5<16) and are the responsibility of the respondent (HE1 = 1).</p> <p>The random child and the random schoolchild may be the same person.</p>

It is shown here because many derived variables use the person number of the HIH to derive other variables about the HIH (see below).</p>

In many instances it is useful to derive random adult variables from household variables. For example, the age of the random adult is derived from the block of household variables that collect the age of all household members (HA5_1 to HA5_10). The variable in this block that corresponds to the value of RANDPEO holds the age of the random adult.</p> <p>Many random adult variables are already derived (see below) but many that could be derived are not.</p>

DAY	Day of interview																							
MONTH	Month of interview																							
YEAR	Year of interview																							
R_DAY	Day of interview – random adult																							
R_MONTH	Month of interview – random adult																							
R_YEAR	Year of interview – random adult																							
QUARTER	Quarter interview took place in	Note: Q1 can refer to period January to March of survey year (eg 2008) or where mopping up continues into the following year, can refer to the next year (eg interviews in January 2009).																						
SMONTH	Sample month	Batches of addresses are randomly allocated to months of the year so that there is an even spread of interviewing. SMONTH shows the month an address is allocated to. Where an interview did not take place in the month of issue, SMONTH is not equal to MONTH.																						
SYEAR	Sample year	Depending on the local authority and where the area uses clustered or unclustered sampling, addresses or batches of addresses, are randomly allocated to survey years. Variable derived from the six character string TESTY – sample year is the last digit. <code>compute s_year = substr(testy,6,1) .</code> The values correspond to DYEAR and reflect the year of the survey – 1999 was the first year of the survey and has a value of 1 etc.																						

Variable name	Variable and value labels	Explanation																														
DYEAR	Data year / survey script used	Data year indicates which data file the record belongs to and therefore which script was used to generate the data. Useful when datasets have been joined for analysis. Data year may differ from YEAR if, for example, the 2007 dataset contains records for interviews carried out in 2008 on the 2007 survey script.

For example, the 2007 dataset has values and labels for DYEAR up to 9. When merging files, SPSS assigns the values from the active dataset to matching variables. To preserve labels when merging data files, bring older data files into more recent data files.

SHS_6CLA	Scottish Government six-fold Urban Rural Classification	Using respondents' home postcodes, households have been classified as follows:
	Value Label	Large urban areas - households in the city conurbations of Edinburgh, Aberdeen, Dundee, and Glasgow (settlements over 125,000 population).
	1 Large urban areas	Other urban areas – households in settlements of 10,000 to 125,000 people.
	2 Other urban areas	Accessible small towns – households in settlements of between 3,000 and 10,000 people and within 30 minutes drive of a settlement of 10,000 or more.
	3 Accessible small towns	Remote small towns – small towns (between 3,000 and 10,000 people) with a drive time of more than 30 minutes to a settlement of 10,000 or more.
	4 Remote small towns	Accessible rural – households in settlements of less than 3,000 people and within 30 minutes drive of a settlement of 10,000 or more.
	5 Accessible rural	Remote rural – households in settlements of less than 3,000 people and with a drive time of more than 30 minutes to a settlement of 10,000 or more.
NEWRURAL	Scottish Government eight-fold Urban Rural Classification	Isolated houses and hamlets are included in settlements of less than 3,000 people.
	Value Label	Similar to SHS_6CLA except that categories 4 and 6 are split to distinguish remote and very remote settlements. Category 4 of SHS_6CLA splits into categories 4 and 5 of NEWRURAL:
	1 Large urban areas	Remote small towns – small towns (between 3,000 and 10,000 people) within a drive time of between 30 and 60 minutes of a settlement of 10,000 or more.
	2 Other urban	Very remote small towns – small towns (between 3,000 and 10,000 people) over 60 minutes drive of a settlement of 10,000 or more.
	3 Small accessible towns	Category 6 of SHS_6CLA splits into categories 7 and 8 of NEWRURAL:
	4 Small remote towns	Remote rural – households in settlements of less than 3,000 people and within a drive time of between 30 and 60 minutes of a settlement of 10,000 or more.
	5 Very remote small towns	Very remote rural - households in settlements of less than 3,000 people, over 60 minutes drive of a settlement of 10,000 or more.
6 Accessible rural		
7 Remote rural		
8 Very remote rural		
LA_WT	Weight for analysis of household information - main sample only	In 2009 a comprehensive review of the weighting strategy for the SHS resulted in significant changes to the weighting on the SHS. The weighting is explained in detail in the survey technical report but in summary, the weight on the main SHS has been augmented by calibrated weights that address observable biases in the data and allow population estimates to be made. The new calibrated weight is now named LA_WT to ensure that the revised weight becomes the default choice. The previous weight is named LA_OLDWT and the grossing weight to provide population estimates is name LA_GRWT. Similar weights are derived for the random adult: IND_WT, IND_OLDWT and IND_GRWT.
IND_WT	Weight for analysis of random adult information - main sample only	
LA_CS	Weight for analysis of household information - C&S sample only	
IND_CS	Weight for analysis of random adult information - C&S sample only	
LA_ALL	Weight for analysis of household information - whole sample	
IND_ALL	Weight for analysis of random adult information - whole sample	
KID_WT	Weight for analysis of the random schoolchild	
RANKIDWT	Weight for analysis of the random child

If age is missing, whether a person is an adult can be determined by their relationship to the HIH, who is, by definition an adult.</p> <p>Adult relationships are where a person with missing age information is the HIH, the spouse of the HIH or any of Son-in-law/daughter-in-law, Parent (including foster parent), Stepparent, Parent-in-law or Grandparent.</p> <p>AGE is a version of the age variables HA5 created in the process of checking and cleaning the age and date of birth variables. Once all processing is complete, the original age variables (HA5) are over-written with the clean data in AGE.</p>

Thus, in practice, the random schoolchild is aged between 4 and 18 years whereas the random child is aged from zero to 15 years.</p>

PERSON SPECIFIC VARIABLES	<p>A range of person-specific variables are derived from the block of questions that collect details of all household members. The general form of the syntax is the same for each variable – the person identifier is used to find which of the variables in each block of 10 relates to that person and the value is copied into a new variable.</p> <p>For example, the random adult identifier RANDPEO can range from 1 to 10 and corresponds to each age variable HA5_1 to HA5_10. The HA5 variable that relates to RANDPEO in each case is found as follows:</p> <pre> vector age = age_1 to age_10 . compute randage = \$sysmis . loop #i = 1 to 10 . do if rand_ok = 1 . if #i = randpeo randage = age(#i) . end if . end loop . </pre> <p>This form of syntax can be used with any block of 10 variables such as sex, economic status etc, and any of the person flags (SPNUMO, KIDPNO, RANKIDNO, HA2) to derive a corresponding variable.</p>	<p>The Person-specific variables contained in the data file for 2007 are:</p> <p>AGE</p> <p>HIHAGE – Age of the Highest Income Householder RANDAGE – Age of the random adult SPAGE – Age of the spouse/partner of the HIH RANKIDAGE – Age of the random child AGERANK – Age of the random schoolchild</p> <p>BANDED AGE</p> <p>HIHAGEBD – Banded age of the Highest Income Householder AGERBAND – Banded age of the random adult KIDAGE – Banded age of the random child KIDAGEBND – Banded age of the random schoolchild</p> <p>SEX</p> <p>HIHSEX – Sex of the Highest Income Householder RANDSEX – Sex of the random adult SPSEX – Sex of the spouse/partner of the HIH KIDSEX – Sex of the random schoolchild</p> <p>ECONOMIC STATUS</p> <p>HIHECON – Economic status of the Highest Income Householder RANDECON – Economic status of the random adult SPECON – Economic status of the spouse/partner of the HIH KIDECON – Economic status of the random schoolchild</p>
